

Amendment to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) An application editing apparatus for using a computer to edit an application having a model and a view separated from each other, comprising:
 - a computer readable storage medium;
 - an editing module for editing a first model in said application;
 - a model converter for receiving automatically a report of an update to the first model and converting the first model edited by said editing module into a second model, said first model using a view of said second model different from a view of said first model, and said first model not supporting the view of said second model, said second model associated with a different application from said application; and
 - a view display module for using a view of said second model to display said second model on a display device;

wherein said view display module comprises an event generator for generating an event based on an update in said second model if said second model is updated based on an edit of said first model made by said editing module and updates changed portion of the view displayed on said display device based on the event generated by said event generator, wherein the event based on the update in said second model is processed by a markup language processor.
2. (Original) The application editing apparatus according to Claim 1, wherein said view display module further comprises a difference extractor for extracting a difference between said

second models before and after an update if said second model is updated based on an edit of said first model made by said editing module; and said event generator generates said event by using information about said difference extracted by said difference extractor as a parameter.

3. (Original) The application editing apparatus according to Claim 1, wherein said model converter converts an individual element of said first model into a corresponding element of said second model.

4. (Original) The application editing apparatus according to Claim 1, wherein, if said second model contains no element corresponding to a converted element of said first model, said model converter adds an element corresponding to said converted element to said second model.

5. (Original) The application editing apparatus according to Claim 1, wherein said model converter converts an element edited by said editing module in said first model into a corresponding element in second model and updates said second model with said converted element.

6. (Currently Amended) An application editing apparatus for using a computer to edit an application having a model and a view separated from each other, comprising:

a computer readable storage medium;

an editing module for editing a first model in said application;

a model converter for receiving automatically a report of an update to the first model and converting the first model edited by said editing module into a second model, said first model

using a view of said second model different from a view of said first model, and said first model not supporting the view of said second model, said second model associated with a different application from said application;

a view display module for using a view of said second model to display said second model on a display device; and

an event converter for converting an event causing an update made to said first model to be reflected in a view of said first model into an event changing the view of said second model by using a conversion rule for converting said first model into said second model,

wherein said view display module updates changed portion of the view displayed on said display device based on the event generated by said event converter, wherein the event generated by said event converter is processed by a markup language processor.

7. (Currently Amended) A data processing method of using a computer to display a model in a given application in a view in another application, comprising the steps of:

reading a second model in said another application from a data storage storing said given application and updating said second model so that the update is reflected in said second model if a first model in said given application is updated, said updating performed upon receiving automatically a report of an update to the first model, said first model using a view of said second model different from a view of said first model and said first model not supporting the view of said second model, and said another application and said given application being different applications; and

generating an event based on the update made to said second model and, based on said event, updating changed portion of the view displayed on a display device in said another

application, wherein the event based on the update in said second model is processed by a markup language processor.

8. (Original) The data processing method according to Claim 7, wherein said step of changing the view in said another application comprises the steps of:

extracting a difference between said second models before and after the update;

making a change corresponding to said difference to said second model before update to generate said event; and

changing said view based on said event.

9. (Original) The data processing method according to Claim 8, wherein said step of updating said second model comprises the step of converting an individual element of said first model into a corresponding element of said second model, and said step of changing the view in said another application comprises the step of extracting a difference in the individual converted element of said second models before and after the update.

10. (Original) The data processing method according to Claim 7, wherein said step of changing the view in said another application comprises the step of converting an event causing the update made to said first model to be reflected in a view in said given application into an event changing the view in said another application by using a conversion rule for converting said first model into said second model.

11. (Canceled)

12. (Currently Amended) A computer executable program embodied in a storage medium for controlling a computer to edit an application having a model and view separated from each other, said computer executable program causing said computer to operate as:

an editing module for editing a first model in said application;

a model converter for receiving automatically a report of an update to the first model and converting the first model edited by said editing module into a second model, said first model using a view of said second model different from a view of said first model, and said first model not supporting the view of said second model, said second model associated with a different application from said application;

a difference extractor for extracting a difference between said second model and said second model previously converted if said first model is converted by said model converter into said second model;

an event generator for generating an event based on the difference extracted by said difference extractor; and

a view display module for displaying said second model in a view of said second model and, based on the event generated by said event generator, updating changed portion of the view displayed on said display device, wherein the event generated by said event generator is processed by a markup language processor.

13. (Currently Amended) The computer executable program according to Claim 12, wherein said model converter converts an individual element of said first model into a corresponding element of said second model.

14. (Currently Amended) The computer executable program according to Claim 12, wherein said difference extractor extracts a difference between the converted elements before and after the update of said second model.

15. (Currently Amended) An application editing apparatus for using a computer to edit an application having a model and a view separated from each other, comprising:

- a computer readable storage medium;

- an editing module for editing a first model in said application;

- a model converter for receiving automatically a report of an update to the first model and converting the first model edited by said editing module into a second model, said first model using a view of said second model different from a view of said first model, and said first model not supporting the view of said second model, said second model associated with a different application from said application; and

- a view display module for using a view of said second model to display said second model on a display device;

wherein said view display module comprises an event generator for generating an event based on an update in said second model if said second model is updated based on an edit of said first model made by said editing module and updates only changed portion of the view displayed on said display device based on the event generated by said event generator, wherein the event based on the update in said second model is processed by a markup language processor.
